

Synchronizing with macOS

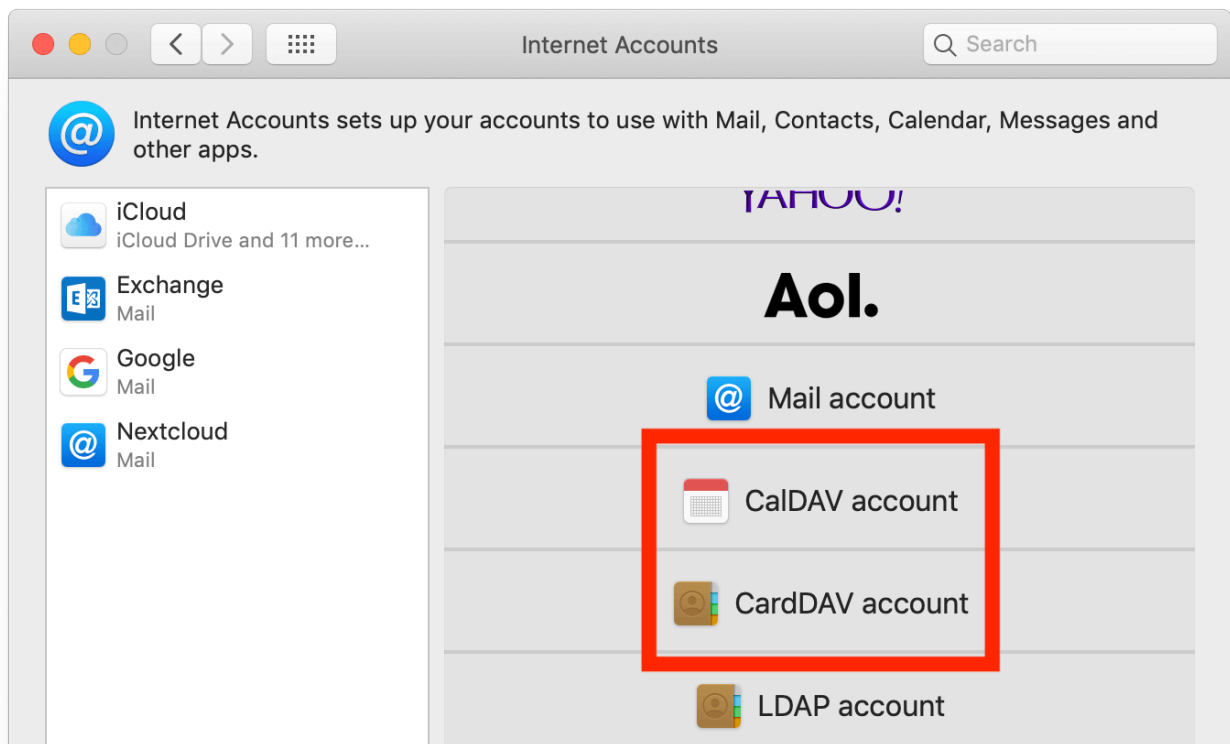

Setup your Accounts

In the following steps you will add your server resources for **CalDAV** (Calendar) and **CardDAV** (Contacts) to your Nextcloud.

1. Open the **system preferences** of your macOS device
2. Navigate to **Internet Accounts**

3. Click on **Add Other Account...** and click on **CalDAV Account** for Calendar or **CardDAV Account** for Contacts.

Note

You can not setup Calendar/Contacts together. You need to setup them in **separate accounts**.

4. Select **Manual** as Account-Type and type in your respective credentials:
Username: Your Nextcloud username or email **Password:** Your generated App-password/token ([App-password/token](#)) **Server Address:** URL of your Nextcloud server (e.g. <https://cloud.example.com>)

Add a CalDAV account

Account Type: Manual

Username: marius

Password: ●●●●●●●●●●●●●●●●

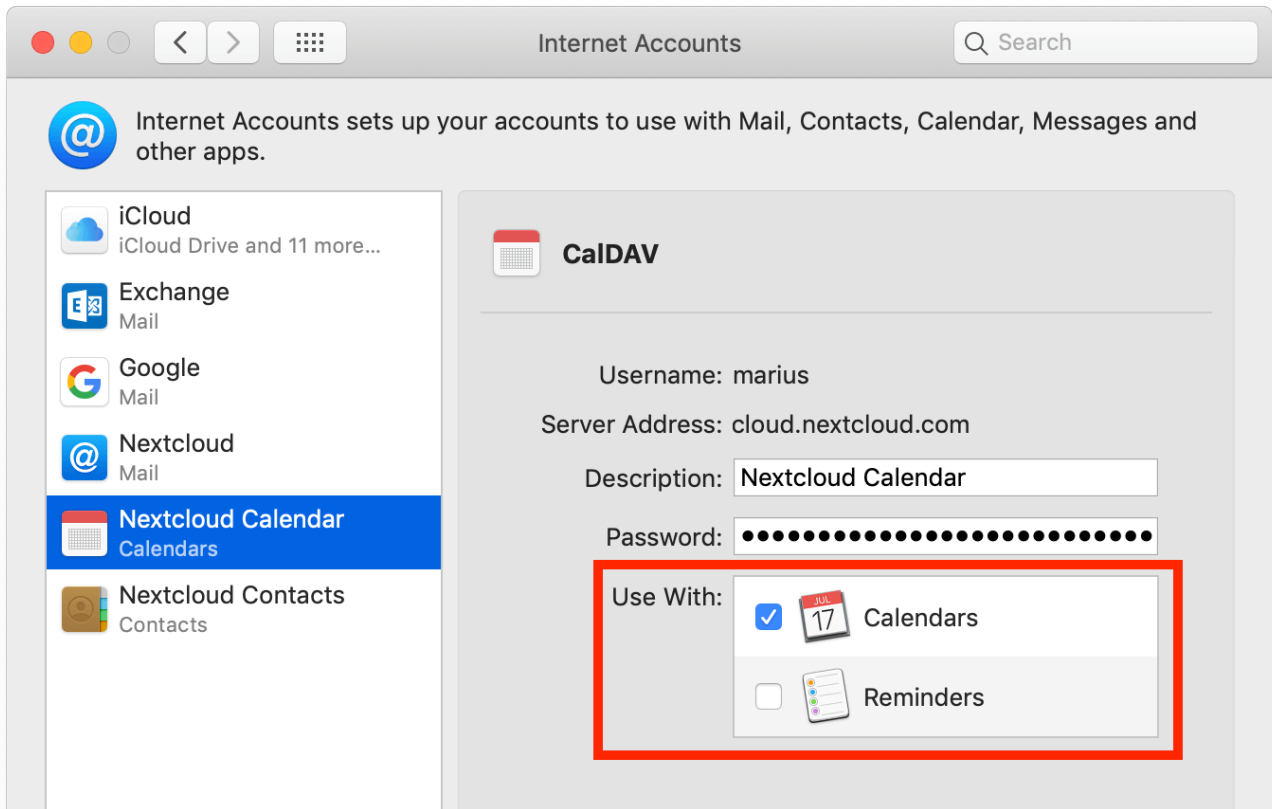

Server Address: cloud.nextcloud.com

Cancel

Sign In

5. Click on **Sign In**.

For CalDAV (Calendar): You can now select, with which applications you want to use this resource. In the most cases, this will be the “Calendar” application, sometimes you may also want to use it for your **Tasks and reminders**.

Troubleshooting

- macOS does **not** support syncing CalDAV/CardDAV over non-encrypted `http://` connections. Make sure you have `https://` enabled and configured on server- and client-side.
- **Self-signed certificates** need to be properly set up in the macOS keychain.
